National Naval Responsibility (NNR) Purpose

To allow ONR to maintain the health/currency/technical superiority of identified Navy-unique S&T in order that:

- A robust U.S. research capability to work on long term S&T problems of interest to the Department of the Navy is sustained;
- An adequate pipeline of new scientists and engineers in disciplines of unique Navy importance is maintained; and
- ONR can continue to provide the S&T products necessary to ensure future superiority in integrated naval warfare.

- **Dynamic Interface: Highly coupled relationship between the ship and aircraft**
 - Moving deck: pitch / roll / yaw / heave / sway / surge
 - Turbulent air wake
 - Small decks; obstructions
- **High Structural Loading**
 - Rigors of shipboard launch and recovery
 - High sink rates
- **Corrosion**
 - Corrosion degradation much more aggressive and damaging than even harsh land-based conditions
 - Compounded by reduced damage tolerance due to high launch and recovery impact loads
- **Deck Operations**
 - Close proximity of other aircraft and personnel
 - Safe handling in rough seas
- **Geometric Constraints & Spotting**
 - Compact aircraft
 - Wing/Rotor folds
- **Shipboard Maintenance**
 - Low physical footprints
 - Maintenance accessible designs
 - Limited spares

What unique or highly Naval-driven science and technology is needed?

Sea-based Aviation (SBA) National Naval Responsibility (NNR) Objective

- The sea-based aviation is both unique and complex and inherently dangerous
- Navy places great emphasis on S&T to maintain Naval superiority
- *Many S&T areas are unique to the Navy

ONR must ensure leadership in sea-based aviation through research, recruitment and education to maintain an adequate talent base and to sustain critical infrastructure

** Weapon, sensors, and ship design are outside the SBA NNR scope*

Overall Challenge

Maintain the health, currency, and technical superiority of Sea-based Aviation S&T.

Focused Technical Challenge Areas

Aero / Autonomy/Ship Interface

Structures

Propulsion

Focused Investments

- Virtual Dynamic Interface (VDI)
 - Advanced Manned/Unmanned HQ & Control for Naval Operations
 - Improved Low-Speed Aerodynamics for Fixed-Wing Aircraft Launch & Recovery
 - Autonomous deck operations
 - Enhanced FW V/STOL Operations
 - Corrosion protection, detection, and mitigation.
-
- Structural Mode Characterization
 - High-Loading, Lightweight Structural Materials
 - Advanced Structural Concepts
 - Materials Degradation/Corrosion
 - Structural Protection /Maintenance
-
- Energy-Efficient Processes and Subsystems
 - Turbomachinery and Drive Systems with Enhanced Maintainability
 - Jet Noise Reduction for TACAIR
 - Hot-Section Materials and Coatings
 - Small UAV Propulsion

Today: More Complexity, Less Durability

- Degradation/corrosion of airframes is the largest maintainability degrader
 - Primarily designed for immediate mechanical / structural response
 - Degradation of properties over the lifecycle is an afterthought / sustainment
- Lack true failure mechanism understanding of load path effects, crack growth, non-isotropic
 - Overdesign, new material limits, costly life extensions, unexpected failures

Corrosion rates on complex structures

Modified Kitagawa Diagram

Future: Advanced Airframes

- Full Airframe Risk and Reliability
 - Multi-material, Predictive
 - Damage Accumulation Decisions
 - Sea-based Environment Impacts
- High-Load/Light Weight Materials
 - Extend operational service life
 - Increase durability, range
- Durable Aircraft and Advanced Concepts

Warfighter Payoff:

- Integrated design analysis /prognosis – optimize airframe structural properties and match material selection to operational requirements
- Light weight, flexible, and degradation resistant advanced materials can improve fatigue life, reduce risk of catastrophic failure and facilitate control of weight/balance
- Model complex behaviors/interactions – predict risk, probability and mechanism of failure; forecast lifetime performance

Business Case:

- Increased Availability/Readiness
- Reduced Sustainment Requirements
- Fatigue/Loads Life Enhancement
- Reduced Weight and Improved Range
- Design tools/Standard Practices

Composite Applications

Technical Challenges:

- Multi-material Analyses – Predict fatigue and fracture
 - Structural damage occurs over multiple length and time scales
- Integrating Structural Response, Lifing, and Degradation Effects
- Multi-Functional Materials Research
- New Material Characterization, Interactions
- More Complex Designs, Reduced Options
- Multi-disciplinary Expertise

High Maneuverability and Load Reduction - Morphing

Risk & Reliability Quantification

Other Challenges:

- Not Flashy – Perception of “Settled”
- Acquisition/Widget Focused
- Not Platform/Hardware Specific
- Materials Underlying Enabler
 - Afterthought in Design
- Good 6.3 Ideas – Lack Support
- COTS , Acquisition Process vs. Military Durability

- Goal: Sea Based Aviation NNR program in the areas of Structures and Materials
 - Other major areas are Aero and Propulsion
 - Conducting parallel technical focus area programs
- SBA NNR officially begins FY14
 - FY13 can be considered a transition year
 - Continuing/new projects should align to SBA NNR roadmaps
- Focus is on Basic and Applied Research
 - Leverage into planned 6.3 transitions

Airframe Structures

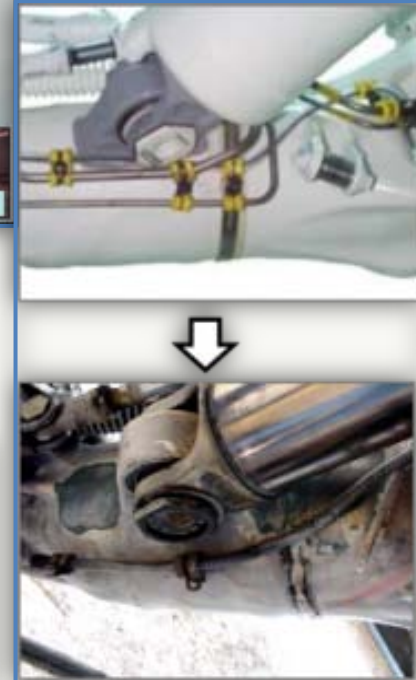

Design, materials selection, fabrication, inspection and maintenance related to air-vehicle structures.

Technical Challenges

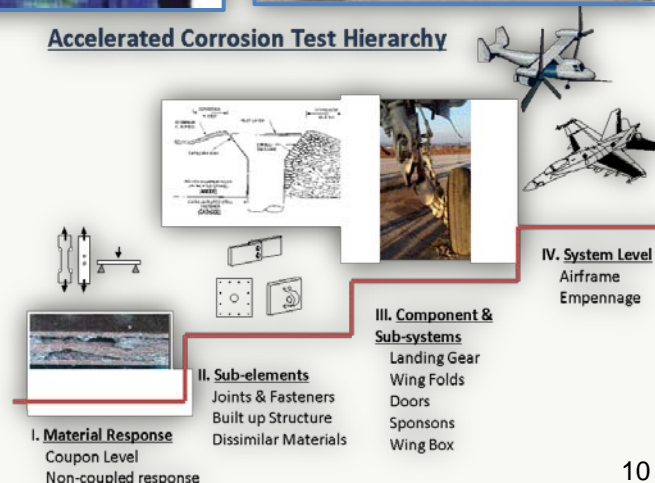

High Loads, Weight Reduction;
Advanced Composites, Shipboard Repair,
Material Coatings, Corrosion,
Structural Life Models.

Focus Areas

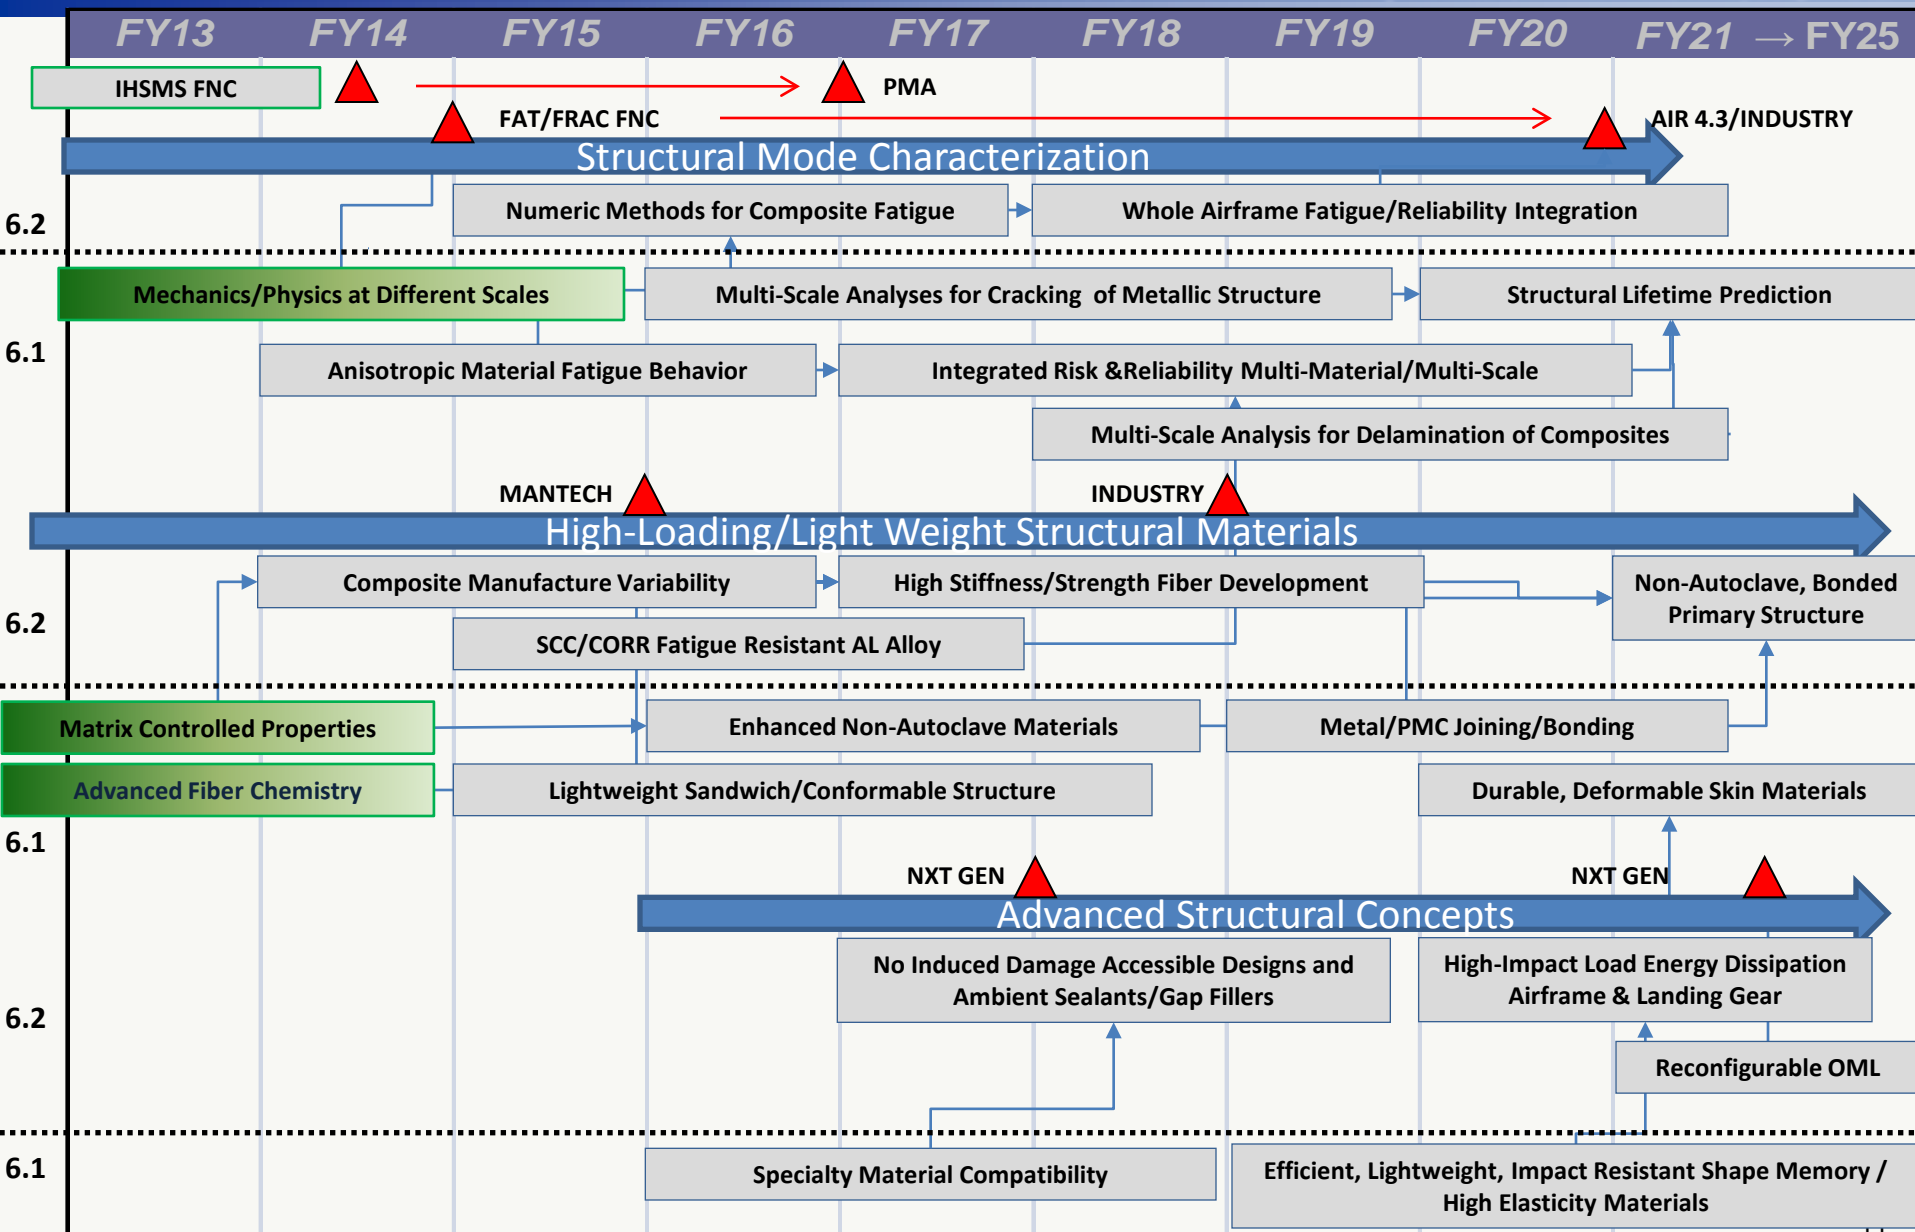

- Structural Mode Characterization
- High-Loading, Lightweight Structural Materials
- Advanced Structural Concepts
- Materials Degradation/Corrosion
- Structural Protection /Maintenance

Accelerated Corrosion Test Hierarchy

Advanced Airframe Products

Structural Mode Characterization – Improved understanding of structural behaviors

Integrated design approaches to high-fidelity airframe life management:

- Fatigue & Fracture – Understanding & modeling of physics with length and complexity scaling
- Damage Characterization – Understanding & modeling progression & residual strength prediction in composites
- Multi-scale analysis – Analytical & computational methods for damage evolution
- Fatigue Enhancements - Modeling of cold working, peening, etc. in metallic structures to quantify life improvements
- Environmental Effects – Incorporating environmental effects into strength, prognosis, and after damage event remaining life
- Bonded Joints – Understanding damage propagation in bonded joints under static and fatigue loading
- Verification & Validation – Structural models used for certification & life prediction
- Risk & Reliability – Quantifying risk & reliability for structural components & integrating whole airframe analysis

High-Loading, Lightweight Structural Materials – Optimize airframe material properties

Making advanced composites more affordable, reliable alternatives:

- Manufacturing variability – Reducing defects in joints and bonds, reducing voids and porosity
- Damage response – Optimizing for improved fatigue/delamination resistance and thermal/moisture damage
- Primary structure – Transverse load path strengthening, crack arrest, out of autoclave resins, matrix/fiber improvements
- Certification – Testing, analysis & methodology improvements for rapid transition

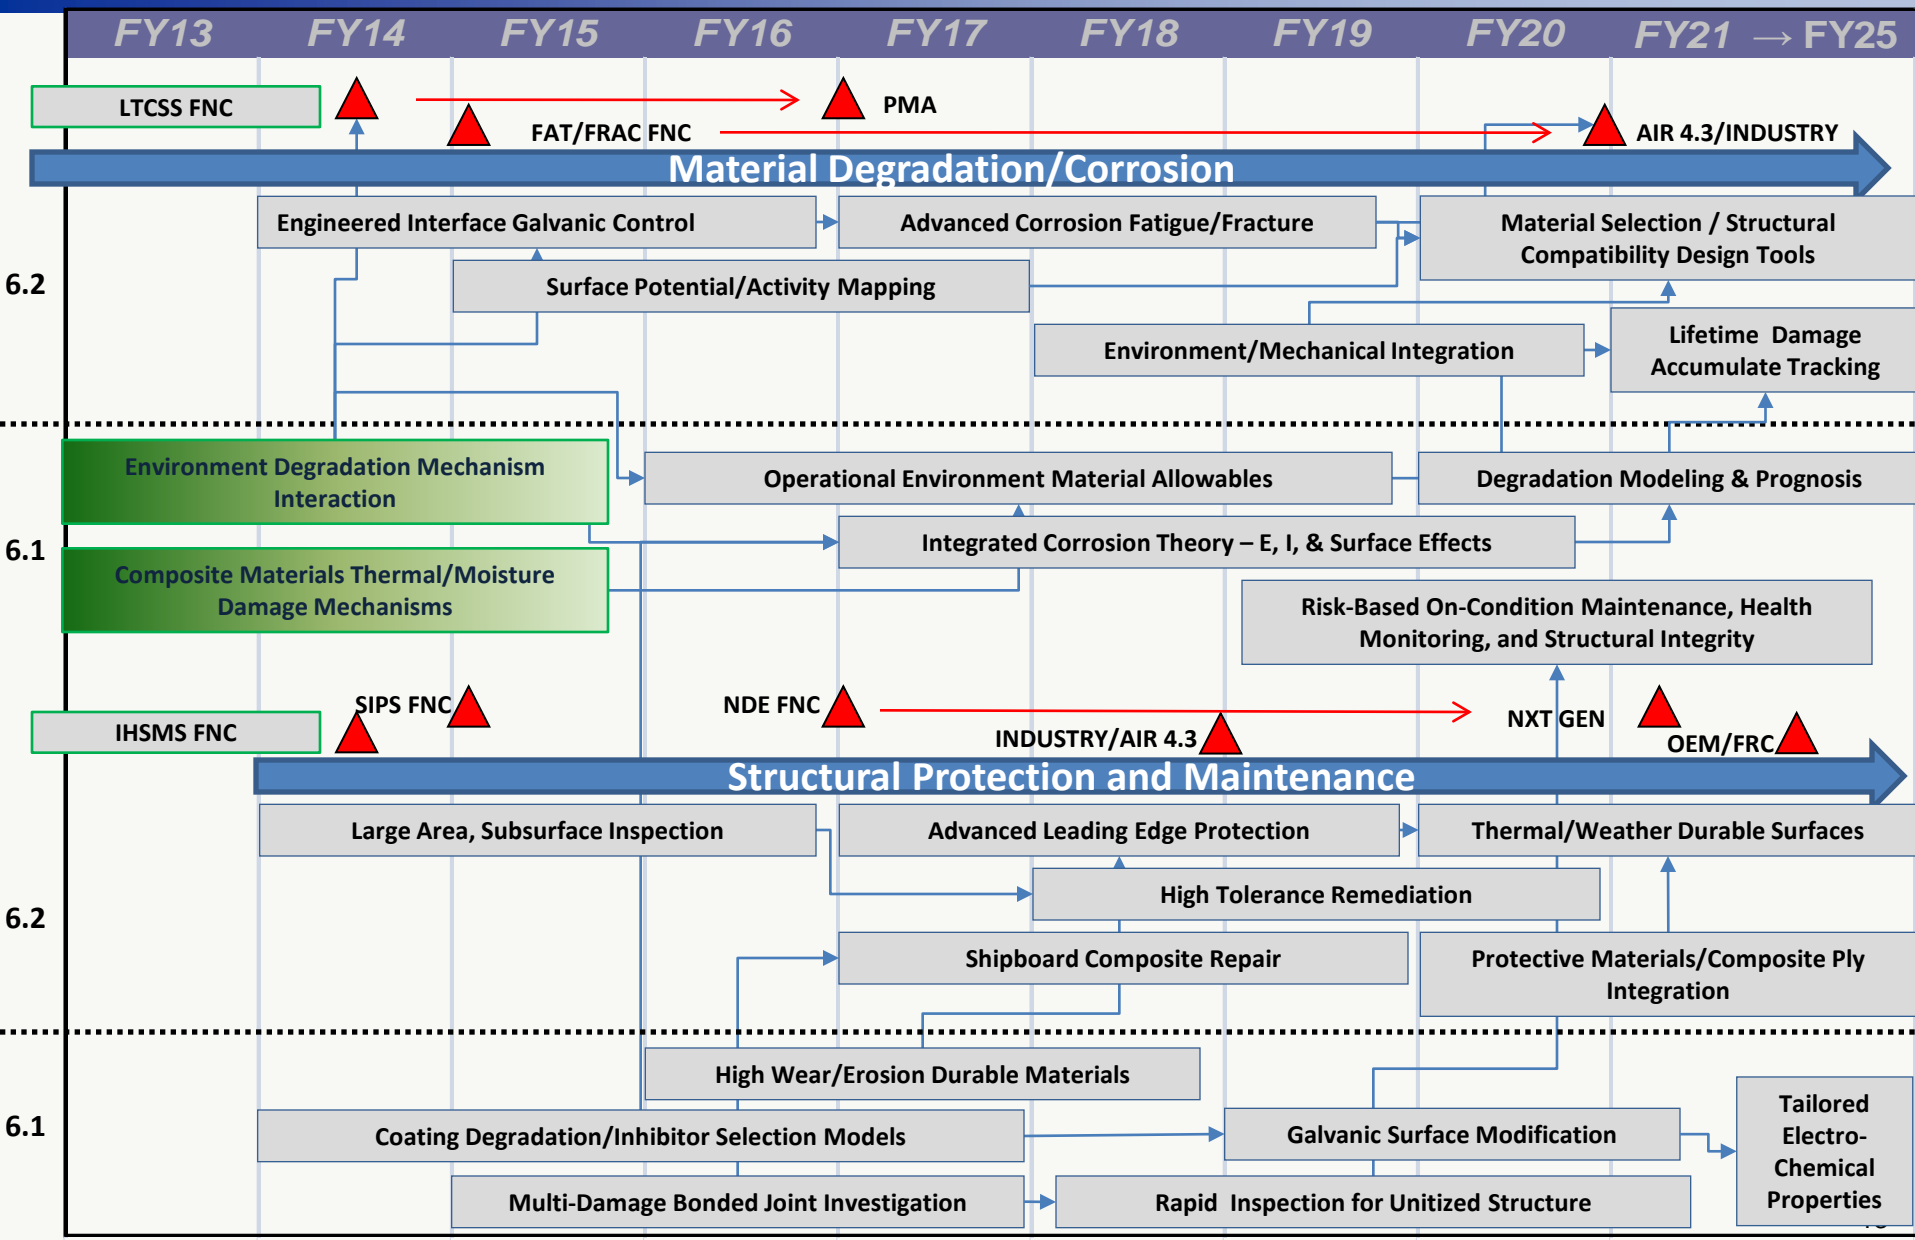

Improve performance and speed transition of advanced metallic structures

- SCC/Corrosion Fatigue – Improved aerospace aluminum, titanium & high-strength steel alloys
- Material Properties Improvements – Higher strength, lighter weight, lower cost, easier fabrication aerospace alloys
- Property Optimization – Improve metal/composite joining, new material characterization, methods for certification & transition
- Lightweight, Conformable Core – Metal foams, composite sandwich, failure mapping

Advanced Structural Concepts – Materials tailored structural responses

Implementation of novel/next gen airframe concepts

- Adaptive structural response – On-demand load response, impulse events, advanced landing gear, reconfigurable structure
- Specialty material systems – Adaptable OML, storage stability and application methods, modeling of interactions

Materials Degradation/Corrosion – Physical/Chemical interactions of operational exposures

Designing, characterizing and optimizing materials for sea-based durability

- Failure mechanisms – Multi-mode degradation mechanisms , complex environments, thermodynamic phase stability
- Multi-scale modeling – Material inputs for coatings, processes, and mechanical/structural interactions in realistic environments
- Surface effects – Chemical potential, electrochemical activity, active/passive compounds, ionic nature, physical morphology
- Environmental/mechanical – Integrate material property degradation and structural/mechanical behavior analyses
- Galvanic management – Potential modification, interface isolation, current control/directional flow characterization
- Materials allowables – Material selection with degradation prediction, engineered interfaces for tailored corrosion response,
- Design tools – Materials selection, galvanic “stress” in complex assemblies, mixed degradation modes, validation processes
- On-condition – Combined integrity, reliability, and maintenance actions based on materials/loads damage accumulation
- Fatigue & Fracture – Integrating degradation initiated mechanical damage and environmental effects on damage propagation
- Testing & Characterization – Measurements and accelerated evaluation methods with operational exposure correlation

Structural Protection /Maintenance – Coatings, industrial processes, NDI, & repair methods

Improve material coatings, portable inspection, and structural repair aboard ship

- Composite bond-line inspection – Rapid inspections to cover large, unitized area for kissing bonds, voids, and bondline strength
- Sub-surface/multi-layer NDE – Through OML, compatible with mixed materials, bond/fastener line and faying surface
- Erosion/leading edge – Combined rain, particle/FOD, and thermal wear protection, adhesion/flex and thermal stability
- Material coatings – Effects of dissimilar material/coatings and chemistry, understanding coating damage and inhibitor functions
- Shipboard maintenance – Storage stability and high-moisture cure chemistry, application/delivery methods for sea-basing,
- Surface modification – Galvanic matching of noble/anodic surfaces, composite ply inherent protection, C-fiber modifications
- Composite repair – In-situ/shipboard repair with load bearing capability and non-autoclave/non-oven cure mechanisms
- Specialty coatings – Compatibility analysis and impact prediction, operational fluids – de-icing/cleaning, material effects

- Timeline for Structures and Materials Sub-Thrust
 - Beginning Government Fiscal Year 2014 (FY14)
 - 6.1/6.2 Funding – Basic and Applied Research
 - Partnerships with DoN Laboratories encouraged (e.g. NAWC, NRL)
 - Program fact sheet – ONR website – July 2012
 - Call for white papers via Special Notice – announcement in AUG 2012
 - Outreach workshop in SEP 2012
 - Invitation to submit full proposal for FY14 efforts in DEC 2012
 - Proposals due FEB 2013
 - Selections made MAY 2013
 - Awards made SEP 2013
 - Validate roadmaps – annual update process

Bill C Nickerson, Program Officer (Detailee)

SBA NNR Structures and Materials, 6.1/6.2 Lead
